MR. LIFE MANAGER · REFERENCE GUIDE

Is the light the problem?

Test one activity in one room before buying anything.

> **BEFORE YOU START:**
> choose an activity, such as reading in a chair, and the time you normally do it. Have the book or task in place. Use only existing working lights you can move safely. A new fixture, wiring work or a purchase is a separate job.

1. Try the activity as it is.

Sit where you normally sit, at the usual time of day. Can you see the page or work clearly? Note glare, a shadow over the task, an uncomfortable reflection, or a light that feels too harsh or dim to you.

2. Change one thing and try again.

Open or close the curtain, switch an existing light on or off, or reposition a portable lamp if its instructions and cord reach allow. Keep cords out of paths and lamps stable. Test the same activity after each change.

3. Put light where you need it.

For reading or desk work, try an existing lamp beside the activity so your body does not block it. Keep enough general

light for moving around. More lamps or lower light are preferences to test, not requirements for every room.

4. If a bulb needs replacing, check the fixture first.

Follow fixture instructions for bulb base, type, wattage limit, enclosure and dimmer compatibility. Switch the light off and let the bulb cool before replacing it. Use safe access. Ask for help with inaccessible fittings. Do not take a bulb from another fixture unless it is suitable for this one.

5. Compare the numbers on the box.

Lumens describe light output; watts describe electricity use. Kelvin describes light color: lower numbers look warmer, higher numbers cooler. Choose a brightness and appearance that suit your activity and preference. Matching colors can be worth trying; it is not a universal comfort rule.

THE FINISH

Try the activity again under the intended conditions.

If it works comfortably, leave the safe arrangement ready to use. If it does not, record the specific problem and what you need to check next. A recorded equipment need is a diagnosis, not an improved sitting spot. Do not call a daytime trial a completed evening test.
